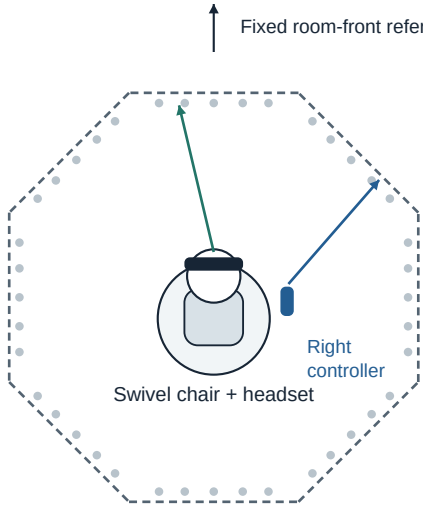
Follow My Voice: setup and session flow

October 1, 2026 | Local implementation + proposed operator flow; headset acceptance pending

A Seated mixed-reality setup



8 virtual surfaces around the seated participant

168 scattered objects; dots are schematic

- Virtual surface, not a physical wall
- Eye gaze informs guidance and measurement
- Right ray highlights; trigger selects

B Session flow

Preferred / self-similar voice order is counterbalanced

- Consent and baseline questions
- Fit; choose gender + 1 of 6 voices
  Natural sample + audio level checks
- Eye calibration + independent spatial check
- 2 practice trials: one with each voice
- **Block 1: 40 measured trials**
- Block questions, break, fit / drift check
- **Block 2: 40 trials with the other voice**
- Block questions, final interview and debrief

Setup activities are grouped; final survey route is open.

Within each trial

Previous-wall cross + spoken readiness → Reveal objects; start search clock → Horizontal guidance, then up / down → Right-ray highlight; trigger confirmation → Record correct capture; chime + praise, advance

Incorrect: same target; continue

The agent knows the target; its identity is not announced or shown to the participant.

Requested pauses stop active-search timing. Invalid / stale gaze suspends new guidance decisions.

Implementation: 40 + 40 trials, shared command wording, right controller. Proposal: operator / survey flow.

Open: final surveys, signed-height quotas, participant sample size, spatial / timing acceptance and hardware checks.
