

Visual Search in Virtual Reality (VSVR): A Visual Search Toolbox for Virtual Reality

Jacob Hadnett-Hunter, Eamonn O'Neill, and Michael J. Proulx

Journal of Vision 22(3), Article 19 (2022)

doi:10.1167/jov.22.3.19

Summary

The authors introduce VSVR, a Unity-based toolbox for building controlled visual-search experiments in virtual reality while retaining more natural viewing and interaction than conventional 2D studies. They demonstrate it with three paradigms: feature search, wide-field search with eccentricity effects, and depth-plane search. The toolbox is positioned as a way to improve ecological validity without giving up experimental control.

Document note

This publication is a one-page, peer-reviewed meeting abstract, not a full-length article. The publisher PDF was not downloadable during collection, so this local file contains a citation and an original summary, not a reproduction of the source. The authoritative record is linked by DOI above.
